In the Claims:

Cancel claims 7-17 and add the following new claims:

Claims 7-17 (canceled)

- 18. (new) A method of simulating a missile by means of a missile simulator during testing of an aircraft which includes a weapon system for controlling missiles with which the aircraft may be equipped, the method comprising:
- i) generating a target seeker command position for a target seeker in the missile, whereby the target seeker is commanded to adopt a predetermined position;
- ii) simulating the behavior of the missile in a computer model to generate an actual value signal adapted to the weapon systems;
- iii) generating a trouble signal from a deviation between the target seeker command position and the actual value signal;
 - iv) using the trouble signal as a control signal for the target seeker; and
 - v) repeating steps ii) iv).
- 19. The method in accordance with claim 18, wherein the trouble signal is measured continuously and wherein sampled values for a vector indicating error in amplitude (A) and error in phase angle (φ), which represent a difference between a vector S^C corresponding to the target seeker command position and a vector S_O corresponding to the actual value signal, are determined and sent to the computer model in the missile simulator.

- 20. (new) The method in accordance with claim 19, wherein for each trouble signal, the computer model determines a corresponding actual value signal.
- 21. (new) The method in accordance with claim 20, wherein for each trouble signal the computer model determines a new vector S^C including an amplitude and a phase angle of the new target seeker command position.
- 22. (new) The method in accordance with claim 20, wherein a time-continuous actual value signal is reproduced from a time-discrete vector from the computer model.
